

Data Examples

Class outline:

- Linked lists
- Lists
- Objects

Linked lists

Exercise: Is it ordered?

Is a linked list ordered from least to greatest?

```
def ordered(s):  
    """Is Link s ordered?  
  
    >>> ordered(Link(1, Link(3, Link(4))))  
    True  
    >>> ordered(Link(1, Link(4, Link(3))))  
    False  
    >>> ordered(Link(1, Link(-3, Link(4))))  
    False  
    """
```

Exercise: Is it ordered? (Solution)

Is a linked list ordered from least to greatest?

```
def ordered(s, key=lambda x: x):
    """Is Link s ordered?

    >>> ordered(Link(1, Link(3, Link(4))))
    True
    >>> ordered(Link(1, Link(4, Link(3))))
    False
    >>> ordered(Link(1, Link(-3, Link(4))))
    False
    """
    if s is Link.empty or s.rest is Link.empty:
        return True
    elif s.first > s.rest.first:
        return False
    else:
        return ordered(s.rest)
```

Exercise: Is it ordered? Part 2

Is it ordered when a key function is applied, like `abs`?

```
def ordered(s, key=lambda x: x):
    """Is Link s ordered?

    >>> ordered(Link(1, Link(3, Link(4))))
    True
    >>> ordered(Link(1, Link(4, Link(3))))
    False
    >>> ordered(Link(1, Link(-3, Link(4))))
    False
    >>> ordered(Link(1, Link(-3, Link(4))), key=abs)
    True
    >>> ordered(Link(-4, Link(-1, Link(3))))
    True
    >>> ordered(Link(-4, Link(-1, Link(3))), key=abs)
    False
    """
```

Exercise: Is it ordered? Part 2 (Solution)

Is it ordered when a key function is applied, like `abs`?

```
def ordered(s, key=lambda x: x):
    """Is Link s ordered?

    >>> ordered(Link(1, Link(3, Link(4))))
    True
    >>> ordered(Link(1, Link(4, Link(3))))
    False
    >>> ordered(Link(1, Link(-3, Link(4))))
    False
    >>> ordered(Link(1, Link(-3, Link(4))), key=abs)
    True
    >>> ordered(Link(-4, Link(-1, Link(3))))
    True
    >>> ordered(Link(-4, Link(-1, Link(3))), key=abs)
    False
    """
    if s is Link.empty or s.rest is Link.empty:
        return True
    elif key(s.first) > key(s.rest.first):
        return False
    else:
        return ordered(s.rest)
```

Exercise: Sorted merged list

Create a sorted Link containing all the elements of two sorted Links.

```
def merge(s, t):  
    """Return a sorted Link containing the elements of sorted s & t.  
  
    >>> a = Link(1, Link(5))  
    >>> b = Link(1, Link(4))  
    >>> merge(a, b)  
    Link(1, Link(1, Link(4, Link(5))))  
    >>> a  
    Link(1, Link(5))  
    >>> b  
    Link(1, Link(4))  
    """
```

Exercise: Sorted merged list (Solution)

Create a sorted Link containing all the elements of two sorted Links.

```
def merge(s, t):  
    """Return a sorted Link containing the elements of sorted s & t.  
  
    >>> a = Link(1, Link(5))  
    >>> b = Link(1, Link(4))  
    >>> merge(a, b)  
    Link(1, Link(1, Link(4, Link(5))))  
    >>> a  
    Link(1, Link(5))  
    >>> b  
    Link(1, Link(4))  
    """  
    if s is Link.empty:  
        return t  
    elif t is Link.empty:  
        return s  
    elif s.first <= t.first:  
        return Link(s.first, merge(s.rest, t))  
    else:  
        return Link(t.first, merge(s, t.rest))
```

Exercise: Sorted merged list II

This time, do it without creating any new `Link` objects.

```
def merge_in_place(s, t):  
    """Return a sorted Link containing the elements of sorted s & t.  
  
    >>> a = Link(1, Link(5))  
    >>> b = Link(1, Link(4))  
    >>> merge_in_place(a, b)  
    Link(1, Link(1, Link(4, Link(5))))  
    >>> a  
    Link(1, Link(1, Link(4, Link(5))))  
    >>> b  
    Link(1, Link(4, Link(5)))  
    """
```

Exercise: Sorted merged list II (Solution)

This time, do it without creating any new `Link` objects.

```
def merge_in_place(s, t):  
    """Return a sorted Link containing the elements of sorted s & t.  
  
    >>> a = Link(1, Link(5))  
    >>> b = Link(1, Link(4))  
    >>> merge_in_place(a, b)  
    Link(1, Link(1, Link(4, Link(5))))  
    >>> a  
    Link(1, Link(1, Link(4, Link(5))))  
    >>> b  
    Link(1, Link(4, Link(5)))  
    """  
    if s is Link.empty:  
        return t  
    elif t is Link.empty:  
        return s  
    elif s.first <= t.first:  
        s.rest = merge_in_place(s.rest, t)  
        return s  
    else:  
        t.rest = merge_in_place(s, t.rest)  
        return t
```

Iterables & Iterators

Exercise: Find indices

What are the indices of all elements in a list that have the smallest absolute value?

```
[-4, -3, -2, 3, 2, 4] → [2, 4]  
 0  1  2  3  4  5
```

```
[1, 2, 3, 4, 5, 6] → [0]  
 0  1  2  3  4  5
```

```
def min_abs_indices(s):  
    """Indices of all elements in list s that have the smallest absolute value.  
  
    >>> min_abs_indices([-4, -3, -2, 3, 2, 4])  
    [2, 4]  
    >>> min_abs_indices([1, 2, 3, 4, 5])  
    [0]  
    """
```

Exercise: Find indices (Solution)

What are the indices of all elements in a list that have the smallest absolute value?

```
[-4, -3, -2, 3, 2, 4] → [2, 4]  
 0   1   2   3   4   5
```

```
[1, 2, 3, 4, 5, 6] → [0]  
 0   1   2   3   4   5
```

```
def min_abs_indices(s):  
    """Indices of all elements in list s that have the smallest absolute value.  
  
    >>> min_abs_indices([-4, -3, -2, 3, 2, 4])  
    [2, 4]  
    >>> min_abs_indices([1, 2, 3, 4, 5])  
    [0]  
    """  
    min_abs = min(map(abs, s))  
    return list(filter(lambda i: abs(s[i]) == min_abs, range(len(s))))  
    # OR  
    return [i for i in range(len(s)) if abs(s[i]) == min_abs]
```

Exercise: Largest sum

What's the largest sum of two adjacent elements in a list?
(Assume length > 1)

```
[-4, -3, -2, 3, 2, 4] → 6  
-7   -5   1   5   6
```

```
[-4, 3, -2, -3, 2, -4] → 1  
-1   1   -5  -1  -2
```

```
def largest_adj_sum(s):  
    """Largest sum of two adjacent elements in a list s.  
  
    >>> largest_adj_sum([-4, -3, -2, 3, 2, 4])  
    6  
    >>> largest_adj_sum([-4, 3, -2, -3, 2, -4])  
    1  
    """
```

Exercise: Largest sum (Solution)

What's the largest sum of two adjacent elements in a list?
(Assume length > 1)

```
[-4, -3, -2, 3, 2, 4] → 6  
-7 -5 1 5 6
```

```
[-4, 3, -2, -3, 2, -4] → 1  
-1 1 -5 -1 -2
```

```
def largest_adj_sum(s):  
    """Largest sum of two adjacent elements in a list s.  
  
    >>> largest_adj_sum([-4, -3, -2, 3, 2, 4])  
    6  
    >>> largest_adj_sum([-4, 3, -2, -3, 2, -4])  
    1  
    """  
    return max([x + y for x, y in zip(s[:-1], s[1:])])  
    # OR  
    return max([s[i] + s[i + 1] for i in range(len(s) - 1)])  
    # OR  
    return max(map(lambda i: s[i] + s[i + 1], range(len(s) - 1)))
```

Exercise: Digits dictionary

Create a dictionary mapping each digit d to the lists of elements in s that end with d .

```
[5, 8, 13, 21, 34, 55, 89] → {1: [21], 3: [13], 4: [34], 5: [5, 55], 8: [8], 9: [89]}
```

```
def digit_dict(s):  
    """Map each digit d to the lists of elements in s that end with d.  
  
    >>> digit_dict([5, 8, 13, 21, 34, 55, 89])  
    {1: [21], 3: [13], 4: [34], 5: [5, 55], 8: [8], 9: [89]}  
    """
```

Exercise: Digits dictionary (Solution)

Create a dictionary mapping each digit d to the lists of elements in s that end with d .

```
[5, 8, 13, 21, 34, 55, 89] → {1: [21], 3: [13], 4: [34], 5: [5, 55], 8: [8], 9: [89]}
```

```
def digit_dict(s):
    """Map each digit d to the lists of elements in s that end with d.

    >>> digit_dict([5, 8, 13, 21, 34, 55, 89])
    {1: [21], 3: [13], 4: [34], 5: [5, 55], 8: [8], 9: [89]}
    """
    return {i: [x for x in s if x % 10 == i]
            for i in range(10) if any([x % 10 == i for x in s])}

# OR
last_digits = list(map(lambda x: x % 10, s))
return {i: [x for x in s if x % 10 == i]
        for i in range(10) if i in last_digits}
```

Exercise: Element comparer

Does every element equal some other element in s?

```
[-4, -3, -2, 3, 2, 4] → False  
[4, 3, 2, 3, 2, 4]   → True
```

```
def all_have_an_equal(s):  
    """Does every element equal some other element in s?  
  
    >>> all_have_an_equal([-4, -3, -2, 3, 2, 4])  
    False  
    >>> all_have_an_equal([4, 3, 2, 3, 2, 4])  
    True  
    """
```

Exercise: Element comparer (Solution)

Does every element equal some other element in s?

```
[-4, -3, -2, 3, 2, 4] → False  
[4, 3, 2, 3, 2, 4]    → True
```

```
def all_have_an_equal(s):  
    """Does every element equal some other element in s?  
  
    >>> all_have_an_equal([-4, -3, -2, 3, 2, 4])  
    False  
    >>> all_have_an_equal([4, 3, 2, 3, 2, 4])  
    True  
    """  
    return min([sum([1 for y in s if x == y]) for x in s]) > 1  
    # OR  
    return all([s[i] in s[:i] + s[i+1:] for i in range(len(s))])  
    # OR  
    return all(map(lambda x: s.count(x) > 1, s))
```

Lists in environment diagrams

List operations

Starting from:

```
s = [2, 3]
t = [5, 6]
```

Operation	Example	Result
<code>append</code> adds one element to a list	<pre>s.append(t) t = 0</pre>	
<code>extend</code> adds all elements in one list to another list	<pre>s.extend(t) t[1] = 0</pre>	
addition & slicing create new lists containing existing elements	<pre>a = s + [t] b = a[1:] a[1] = 9 b[1][1] = 0</pre>	

List operations

Starting from:

```
s = [2, 3]
t = [5, 6]
```

Operation	Example	Result
<code>append</code> adds one element to a list	<pre>s.append(t) t = 0</pre>	<pre>s → [2, 3, [5, 6]] t → 0</pre>
<code>extend</code> adds all elements in one list to another list	<pre>s.extend(t) t[1] = 0</pre>	
addition & slicing create new lists containing existing elements	<pre>a = s + [t] b = a[1:] a[1] = 9 b[1][1] = 0</pre>	

List operations

Starting from:

```
s = [2, 3]
t = [5, 6]
```

Operation	Example	Result
append adds one element to a list	<pre>s.append(t) t = 0</pre>	<pre>s → [2, 3, [5, 6]] t → 0</pre>
extend adds all elements in one list to another list	<pre>s.extend(t) t[1] = 0</pre>	<pre>s → [2, 3, 5, 6] t → [5, 0]</pre>
addition & slicing create new lists containing existing elements	<pre>a = s + [t] b = a[1:] a[1] = 9 b[1][1] = 0</pre>
